

Video Overlay

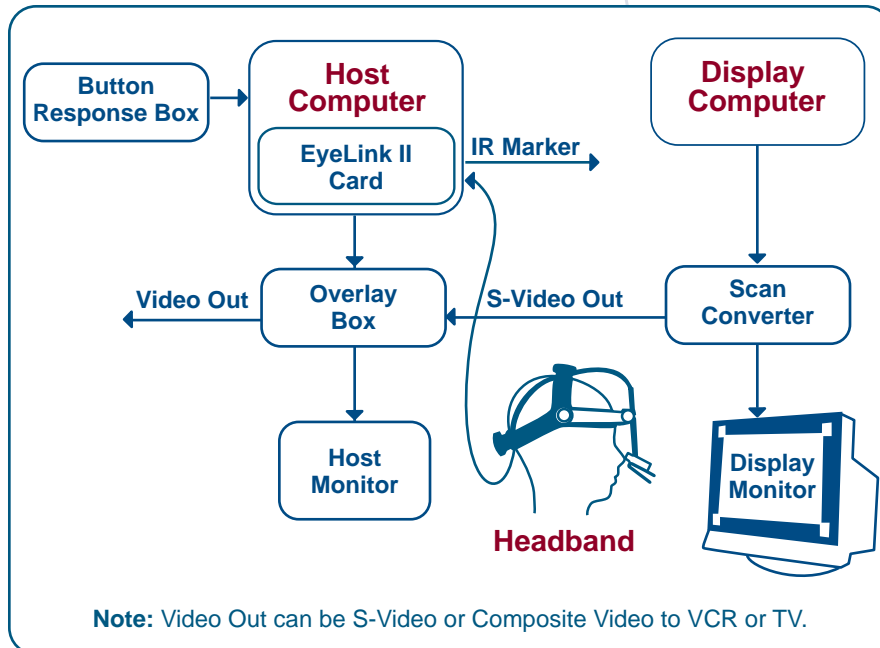

The Gaze Overlay works with the EyeLink II system to generate a real-time gaze overlay graphic on an S-Video source. This option is often used to provide a gaze overlay onto a dynamic stimulus display, like a web browser, AVI file, or DVD movie.

Key Features

- No additional computers required, works with standard system configuration.
- Provides S-Video output of Display PC video with a customizable real-time gaze cursor overlay. Host PC time code can also be displayed.
- Excellent for gaze documentation and demonstration purposes.

This PAL/NTSC composite or S-Video signal is then typically saved onto a VCR or DVD recorder for analysis. This option is ideal for any dynamic moving scene such as non-static website or TV advertisement analysis.

- Can also be used without a Display PC, allowing calibration on a standard TV monitor and subsequent gaze position overlay on TV Video.
- Package includes gaze overlay hardware as well as a modified EyeLink II tracker application that performs the gaze cursor generation.
